

## 1.0 Introduction

System proposal typically outlines the ins and outs of a new system that is aimed to be implemented by an organisation. It involves introduction, background study, problem statement, solutions, objectives, scope of the project, project planning, and benefit and overall summary of the proposed system.

In the modern world, the system of management and planning mainly revolves around a software system, from a business handling numerous transactions daily to people interacting with each other through social media. Therefore, in order to streamline the postgraduate supervision by the supervisor in postgraduate studies, a computer system is proposed to be incorporated in all the local universities.

The system aims to provide a unified platform for supervision of postgraduate studies. It will be available for all higher learning institutes in Malaysia.
